Helpful comments on U.K. examiner's report

A thorough examination of the U.K. examiner's quoted scientific citations reveals profound differences between

'prior art' and this patent application. This application illustrates the use of non-cellular/acellular, extracellular matrices (ECMs) in a 'sandwich' layer superimposed on a natural composite of materials involved in wound repair.

There is no biopolymer preparation using laboratory techniques as described in Black et al 1998. I make use of the science of the constituent composite materials for my simple mixture. Chitosan used by Black et al is '95% deacetylated' (i.e. by a chemical process), dissolved in 0.1% acid (as is collagen and chondroitin 4-6 sulfates) and mixed. They do seed HUVECs on top of their biopolymer but state in the 'Results' section, page 1333 (1) 'most showed features of dying cells' (2) 'very limited' ECM production by HUVECs. They do not detach

post confluent HUVECs using 5mM EDTA as I do, as

their biopolymer scaffold does not support healthy growth of HUVECs.

They do not then go on to superimpose the mixed matrix secreted by both dermal fibroblasts and dermal microvascular endothelial cells onto the HUVECs ECM. Therefore, one can justifiably conclude that there is no 'prior art'.
